Discloses a tire temperature and/or pressure measuring system. Each wheel is equipped with a temperature and/or pressure sensor, which at successive instances transmits a radio frequency message. It is associated with a fixed antenna installed near the axis of the wheel and the wheel rim and is coupled by a filter to a wire link or a connection with a message processor. Consequently, the radio frequency air connection required by each temperature and/or pressure sensor is very short and may be substantially the same for all the wheels.

Relevance

The message processing unit, which is frequently combined with a central processing unit carrying out other functions to form a common module, can then be installed anywhere on the vehicle.

Appears to disclose a tire pressure and temperature sensor arrangement including a transponder/sensor in the tire and an external transceiver.
